

Evaluation Criteria — L1-inception-vision-generator

Quality Gates (must pass)

Criterion	Threshold	Method
All 5 sections present	100%	Automated: check headings
Executive Summary $\leq$ 10 sentences	Pass/Fail	Automated: sentence count
MVP features table has $\geq$ 5 rows	Pass/Fail	Automated: row count
Out-of-scope table has $\geq$ 3 rows	Pass/Fail	Automated: row count
Success metrics have measurable targets	100%	LLM-as-Judge
No placeholder text remaining	0 placeholders	Automated: regex <code>{{.*}}</code>
Artifact uploaded successfully	200 response	Automated: blob upload status

Evaluation Scores (LLM-as-Judge)

Evaluator	Threshold	Direction
Faithfulness	≥ 0.90	Every claim traces to domain KB or stated input
Hallucination	≤ 0.10	No invented market data, statistics, or regulations
Consistency	≥ 0.90	No contradictions between sections
Relevance	≥ 0.85	Content directly serves the stated idea
Reasoning quality	≥ 0.80	Business decisions explained
Domain grounding	≥ 0.90	Feature areas, users, constraints reflect domain KB
Specificity	≥ 0.85	Concrete metrics, not vague aspirations

Quality Rubric

Dimension	Score 9-10	Score 7-8	Score 5-6	Score < 5
Structure	All 5 sections complete with all subsections	All 5 sections, minor subsections missing	Major subsections missing	Sections missing entirely
Domain alignment	Every feature/user/constraint grounded in KB	Most grounded, 1-2 inferred reasonably	Mix of grounded and generic	Generic document, KB ignored
MVP clarity	Clear boundary, explicit in/out scope, testable criteria	Mostly clear, 1-2 ambiguous features	Blurred MVP/vision boundary	No clear MVP boundary
Market insight	Specific competitors, quantified opportunity, clear drivers	Named drivers and users, some quantification	Generic market statements	No market analysis

Dimension	Score 9-10	Score 7-8	Score 5-6	Score < 5
Actionability	Team could start requirements extraction immediately	Minor clarifications needed	Significant gaps before actionable	Not actionable

Reflection Checklist

The agent must self-verify before delivering:

- ☐ All 5 major sections present (Executive Summary, Business Context, Full Scope Vision, MVP Scope, Risks)
- ☐ Executive Summary is 3-5 sentences max
- ☐ Problem Statement is specific, not generic platitudes
- ☐ Business Drivers cite domain-specific context from KB
- ☐ Target Users table has ≥ 3 user types with domain-relevant roles
- ☐ Success Metrics have numeric targets, not "improve" or "increase"
- ☐ Feature Areas are domain-specific capabilities (not generic like "user management")
- ☐ Integration Points reference real systems from the domain
- ☐ User Journeys are end-to-end with numbered steps and outcomes
- ☐ MVP features have clear rationale for inclusion
- ☐ Out-of-scope features explain why deferred
- ☐ Constraints/Assumptions state "Risk if wrong"
- ☐ Risks table has Likelihood + Impact + Mitigation
- ☐ Open Questions feed into requirements analysis
- ☐ No vague language: "world-class", "seamless", "intuitive", "best-in-class"
- ☐ No technology/implementation decisions (that belongs in HLD)
- ☐ Document reads as complete — not a template with gaps

Reflection Process (mandatory)

- Generate** initial vision document following template structure
- Log** [REFLECTING] Checking output against evaluation criteria
- Check** every item in the Reflection Checklist above
- Identify** gaps, vague language, ungrounded claims, or missing sections
- Log** each finding: [REFLECTING] Found: <description>
- Fix** each issue — amend the output silently
- Log** each resolution: [REFLECTING] Resolved: <what was fixed>
- Deliver** only the final corrected output

Writing Quality Rules

These rules apply to the generated markdown document content:

Do

- Be specific and measurable ("reduce processing time by 30%", not "make things faster")
- Clearly separate full vision from MVP — no features in MVP that aren't in full vision
- Include "out of scope" lists — they prevent scope creep
- Write for the delivery team, not executives — avoid marketing language
- State assumptions explicitly so they can be challenged
- Include success criteria that can actually be tested
- Use domain terminology from the KB consistently

Do Not

- Use vague language: "world-class", "seamless", "intuitive", "best-in-class"
- Include technology or implementation details (that belongs in HLD)
- Skip the MVP section or blur its boundary with full vision
- Combine features and user journeys (features = what system does; journeys = how users experience it)
- Assume readers know the business context — write the Problem Statement even if it seems obvious
- Invent statistics or market data not grounded in the domain KB
